Uncertainty
- ⊞ **Understanding**
- ⊞ Scale Bar/Length Traceability & Uncertainty
- ⊞ **Solution**
- ⊞ Integrating Traceable Scale Lengths into USMN
- ⊞ **Results**
- ⊞ Improved CTE Compensation with Uncertainty
Analysis
- ⊞ **Summary**

Process: Scaling 3D Metrology to Ref Temperature

⊠ **Why Scale 3D Measurements?**

- ⊠ Object dimension is dependent on temperature
- ⊠ Reference Temperature is 20°C (68°F)
- ⊠ Nominals are given at reference temperature
- ⊠ Objects are measured at temperatures other than at reference

⊠ **Scale object measurements from actual to reference temperature**

- ⊠ Scale is dependent on:
 - ⊠ Material Properties (CTE)
 - ⊠ Temperature difference from reference
 - ⊠ Object constraints

Thermal Length Compensation

Must scale measurements to reference temperature for comparison against nominals or between surveys

$$L_i = L_0 (1 - \alpha \Delta T)$$

where :

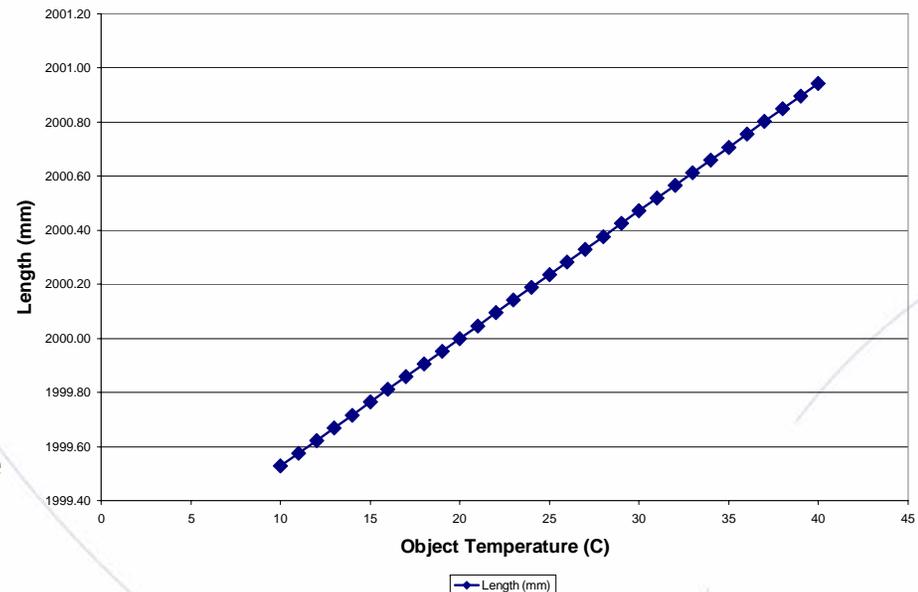

L_i = actual length at temperature

L_0 = calibrated length at reference temperature

α = CTE for scale bar material (ppm/ $^{\circ}$ C)

ΔT = temperature delta between actual and reference temperature ($^{\circ}$ C)

Thermal Length Compensation (2 meter Aluminum Scale Bar)

Objects change length as temperatures changes

Process: 3D Measurement Traceability

- ⊠ **Survey scale is set with calibrated Temperature and CTE**
 - ⊠ Thermocouples to measure object temperature ... e.g., $\pm 0.5^{\circ}\text{C}$ ($k = 2$)
 - ⊠ Published Material Type CTE e.g., $\pm 3\text{-}5\%$ ($k = 2$)
- ⊠ **Survey scale is checked (confirmed) against traceable lengths (NIST, PTB, NPL)**
 - ⊠ Bars calibrated with interferometer at reference temperature
 - ⊠ Fixed Targets on Bars
 - ⊠ Bar Material = Object Material
 - ⊠ Length uncertainty set by lab

Propagation of Uncertainty

- ⊠ **Effect of variable uncertainties (or errors) on the function uncertainty**
- ⊠ **Probable true value lies in interval**
 - ⊠ $x - \Delta x$
 - ⊠ $x + \Delta x$
- ⊠ **Define uncertainty by relative error $\Delta x / x$ (percentage)**
- ⊠ **Assume difference between a measured value and true value is normally distributed using standard deviation as uncertainty of measurement**

Input Component Uncertainties...

- ⊕ **Measurement uncertainty is higher**
 - ⊕ CTE uncertainty characterization is significant (> 5% of CTE)
 - ⊕ Material temperature measurement uncertainty
 - ⊕ Object temperature measurements one or a few observations
- ⊕ **Survey scale is set with uncertain temperature and CTE**
- ⊕ **Process time is lost**
 - ⊕ Get measurements of scale bars to check to tight tolerances ... re-measure bars n times → find right temperature
- ⊕ **Setting scale with less precise process then having to check with higher precision**

CTE Thermal Length Uncertainty

$$L_i = L_0(1 - \alpha\Delta T)$$

$$f(L_0, \alpha, \Delta T) = L_i$$

Uncertainty of L_i is a function of $L_0, \sigma_L, \alpha, \sigma_\alpha, \Delta T, \sigma_T$

Example : 2 meter Alum Scale Bar from 10° to 40° C

$$L_0 = 2000 \text{ mm } \sigma_L = 0.02 \text{ mm}$$

$$\Delta T = -10 \dots 20 \text{ }^\circ\text{C } \sigma_T = 0.5^\circ\text{C}$$

$$\alpha_{alum} = 23.8 \text{ ppm}/^\circ\text{C } \sigma_\alpha = 5\% \alpha$$

Propagation of Uncertainty

$$\text{Model: } L_i = L_0(1 - \alpha\Delta T) = f(L_0)$$

$$U[f] = s_f = \sqrt{\left(\frac{\delta f}{\delta L_0}\right)^2 \sigma_L^2 + \left(\frac{\delta f}{\delta \alpha}\right)^2 \sigma_\alpha^2 + \left(\frac{\delta f}{\delta \Delta T}\right)^2 \sigma_T^2}$$

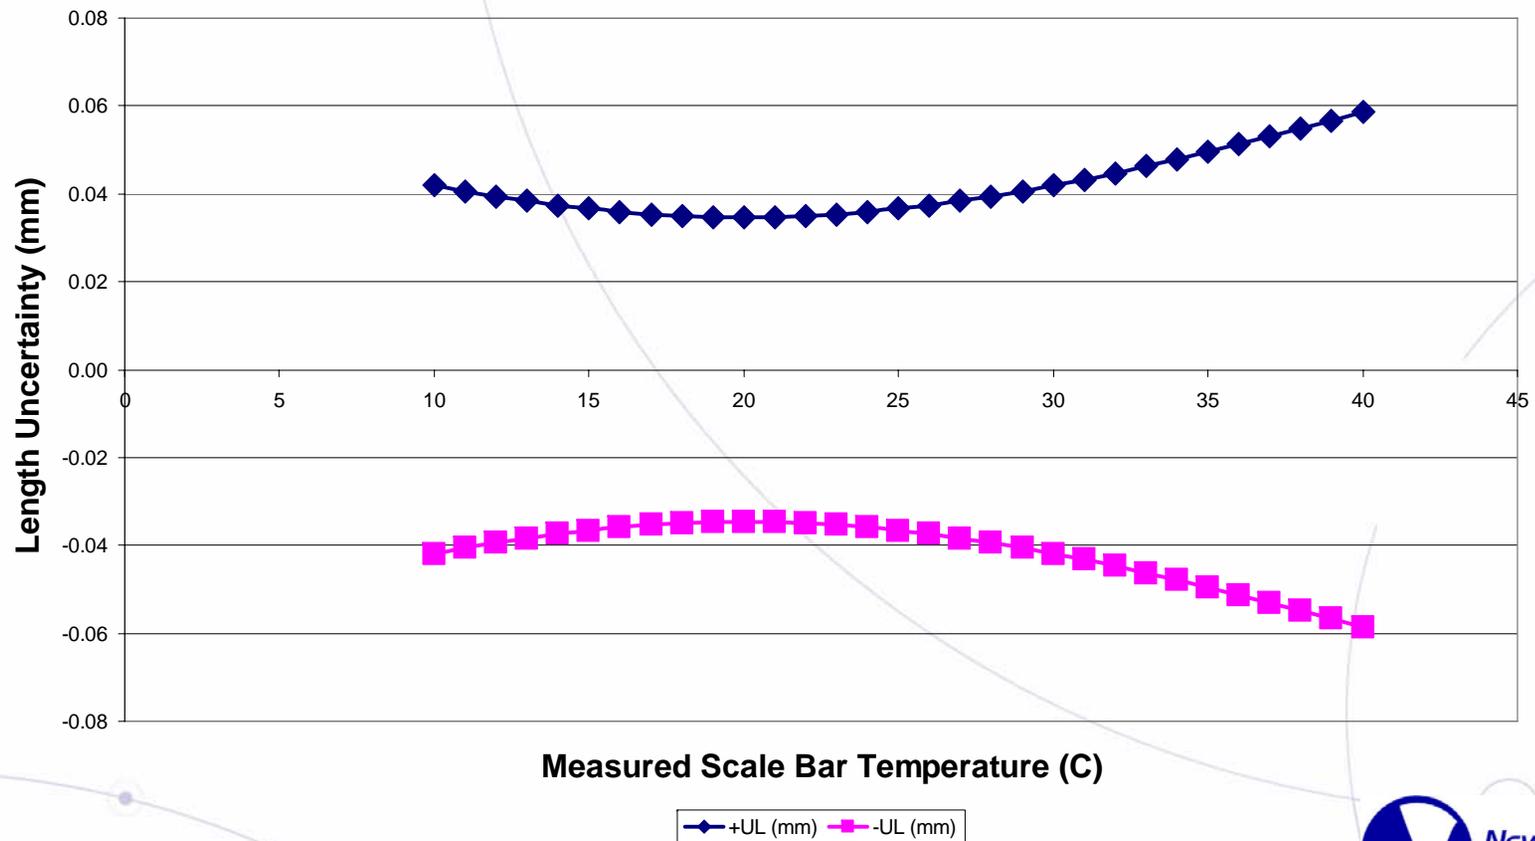

$$U[L_i] = s_L = \sqrt{(1 - \alpha\Delta T)^2 \sigma_L^2 + (L_0\Delta T)^2 \sigma_\alpha^2 + (L_0\alpha)^2 \sigma_T^2}$$

- ⊕ **Formula for the variance between products**
- ⊕ **Propagation of error approach combines estimates from individual auxiliary measurements**

Leo Goodman (1960). "On the Exact Variance of Products" in *Journal of the American Statistical Association*, December, 1960, pp. 708-713.

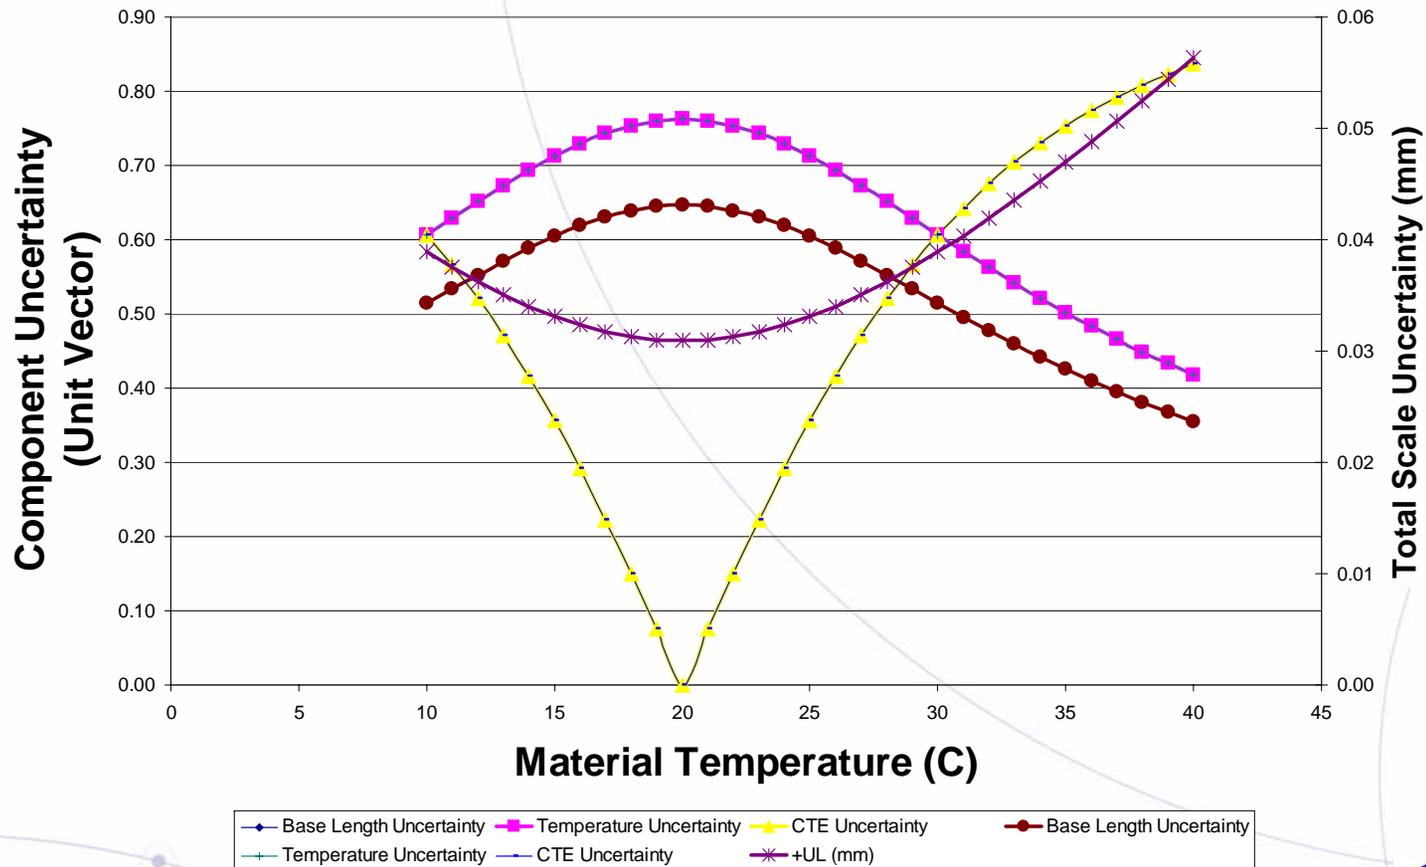

Scale Bar Length Uncertainty vs. Temperature

2-m Alum Scale Bar Length Uncertainty (2-sigma) vs. Object Temperature

Scale Length Uncertainty Components

CTE Scaling Components of Unit Vector

Solution ... Better Metrology Practice

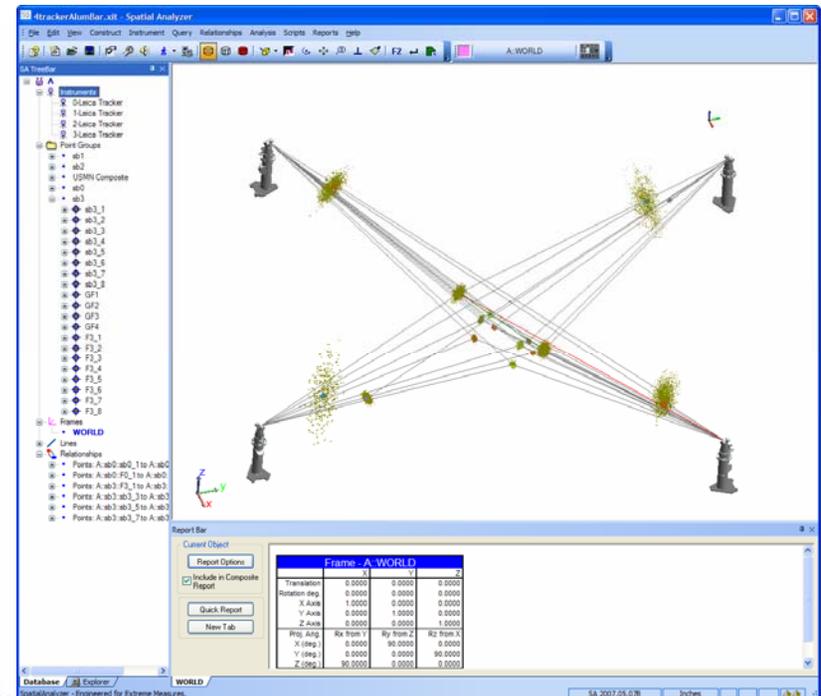

- ⊕ **Use traceable scale lengths to set object scale**
 - ⊕ Certified scale lengths of like kind material (soaked with object)
 - ⊕ Multiple scale bar positions
 - ⊕ Local Scale Differences
 - ⊕ Observations from multiple stations
- ⊕ **Solve with Weighted Mean Scaling (Least Squares) per station/instrument**
- ⊕ **Check scale with temperature and CTE**
 - ⊕ Confirm the scale factor maps to object temperature and material CTE

Scale Length in USMN

- ⊠ **Integrate scale length into Uncertainty Field Analysis**
 - ⊠ Scale length uncertainty from traceable certification
 - ⊠ Multiple bar positions and orientations
 - ⊠ Multiple stations
 - ⊠ Local scale deformations due to object temperature gradient

Scale with Certified Lengths...

- ⊕ **4 Station Survey**
- ⊕ **Alum 2.44 m Scale Bar in 10 positions**
- ⊕ **Temp: $23 \pm 0.5^\circ\text{C}$**
- ⊕ **Max Dist: 9.78 m**
- ⊕ **Potential Error with CTE Scaling ± 0.13 mm**
- ⊕ @22.5 $\rightarrow -0.13$ mm
- ⊕ @23.5 $\rightarrow +0.13$ mm
- ⊕ **Potential Error with Certified Length Scaling ± 0.02**
- ⊕ **Net Difference: 0.11 mm ($\approx \pm 0.004''$ in 386'')**

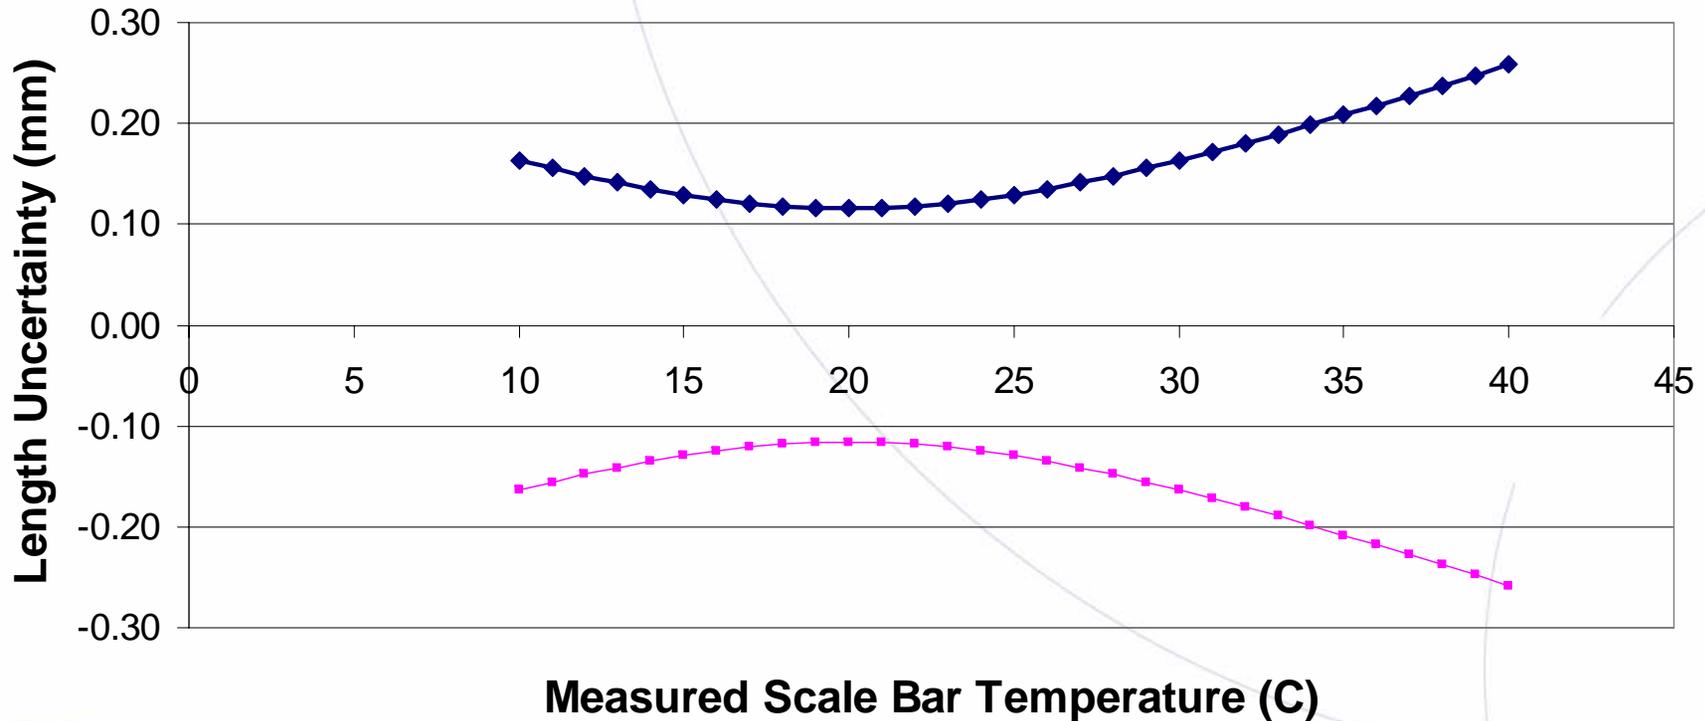

Scaled in USMN 4 stations
10 scale bar positions

Application: Thermal Comp Uncertainty on 9.78-m Aluminum Object

9.78-m Alum Object Length Uncertainty due to Thermal Comp (2-sigma) vs. Object Temperature

0.1 mm = 0.004"

9.78 m = 32 ft

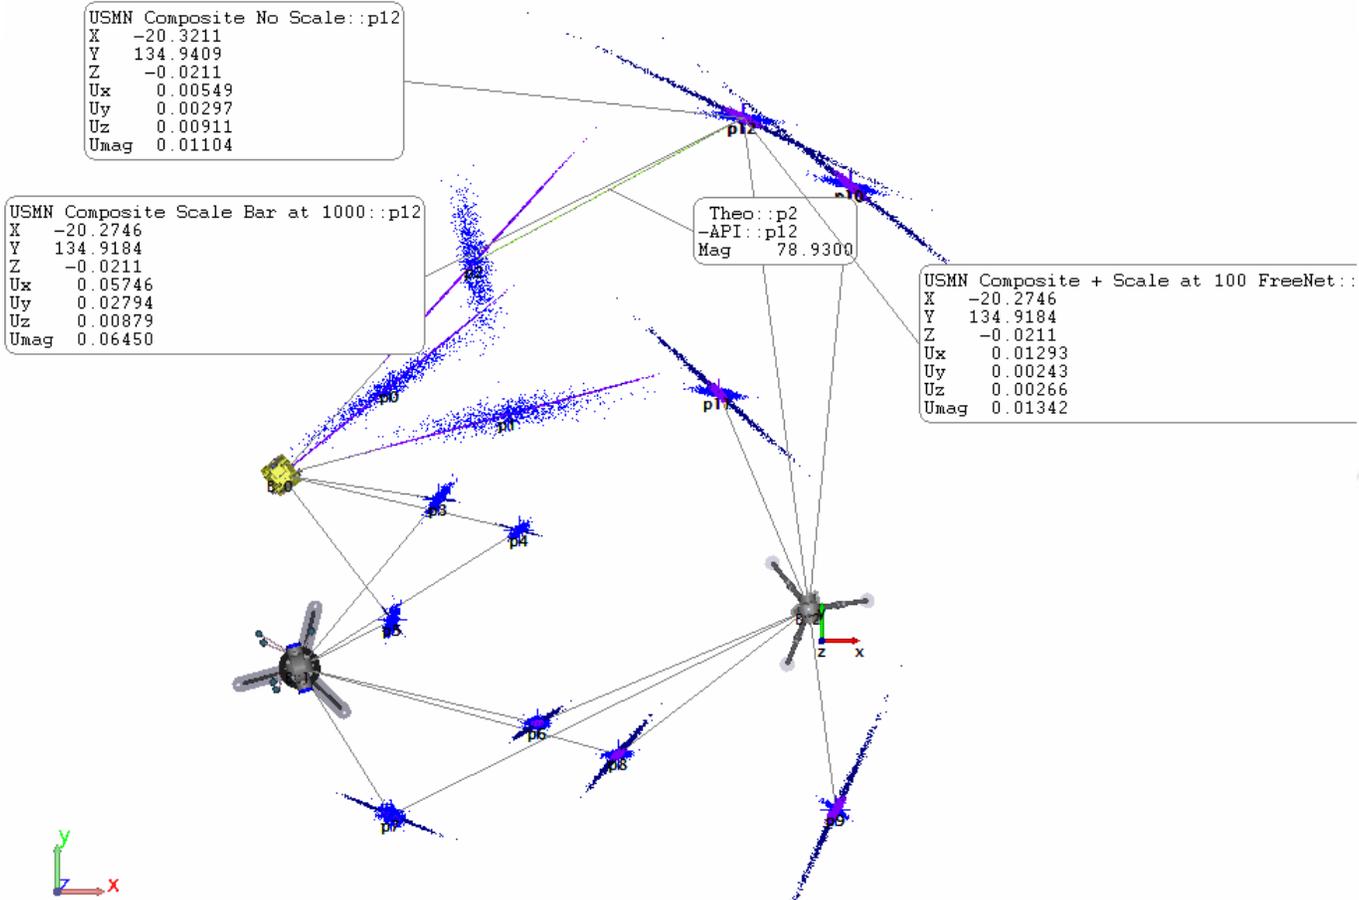

◆ +UL (mm) ■ -UL (mm)

Monte-Carlo Uncertainty Analysis

- ⊕ **Uncertainty Field Analysis includes scale bar constraints**
 - ⊕ Report Only
 - ⊕ As Constraints
 - ⊕ Weighted based on length and published uncertainty from lab
- ⊕ **Monte-Carlo Uncertainty Analysis and Validation for network with modeled scale bar constraints...**
 - ⊕ Confirm an instruments or stations performance within a network against certified length
 - ⊕ Network Target field uncertainty analysis with graphical and component output
- ⊕ **Automated outlier characterization (Ranking %) and possible elimination**
- ⊕ **Shop floor users to consistently and effectively use this advanced optimization technique**

Target Uncertainty Analysis w/ Certified Lengths

Conclusions ... Summary

- ⊠ **Scaling 3D metrology surveys with CTE and object material temperature delta increases uncertainty**
- ⊠ **Scaling with certified lengths reduces measurement uncertainty**
 - ⊠ Reduced Uncertainty
 - ⊠ Enhance Traceable Reporting
- ⊠ **Certified Length Standard are weighted in network optimization**
- ⊠ **Instruments Uncertainty Analysis and Reports are against traceable length standards**
- ⊠ **Target Uncertainty Field Analysis includes traceable length standards**
